PSPT COMMENT: Sat May 30 18:34:03 GMT 1998

I got the filter R+R instructions and message saying the filter was sent to us, but the filter isn't in yet.

LOW-L COMMENT: Sat May 30 19:00:23 GMT 1998

The program was running but the instrument was stowed. I couldn't stop the program using "q" during the "sync" part of the observing cycle. I turned off the power to the PC and tape drives, removed L00520 from drive #0, moved L00521 from drive #1 to drive #0, swapped the old drive #1 with the new drive (I'll call it Test Drive #1) using the new cable that Vic sent us. I then restarted the program, then "q" worked to stop the program and the instrument pointed correctly. I checked the connectors and all of them were 50 pin connectors, from the PC through the new Test Drive #1, Vic wanted to know. All fields are green so it looks like that new RTD sensor for the heater did the trick.

PSPT COMMENT: Sat May 30 21:54:48 GMT 1998

Program crashed at some point after taking some data. Too many error messages for me to write down, xterm was in IDL, I tried to exit using Obs but it wouldn't point the telescope to the right place. I'll see what it does tomorrow, don't have time to spend on this right now.
