PSPT COMMENT: Thu Sep 17 17:08:02 GMT 1998

Noticed that temperature controller is on. There is no log entry or email about it so I will turn it back off, may have gotten turned on while looking for fans in the rack. I will turn it back on if instructed.

PSPT COMMENT: Thu Sep 17 17:37:49 GMT 1998

Haosheng confirmed that the temperature controller should remain off.

MKIII PROBLEM: Thu Sep 17 17:40:38 GMT 1998

Stopping to check MKIII O1. Alice suspects a bit of fluff on it.

Thu Sep 17 17:51:32 GMT 1998 MKIII Start Patrol

MKIII PROBLEM: Thu Sep 17 17:51:40 GMT 1998

There was a small water spot near the edge of the O1. Polished it off with ethyl alcohol and dusted off both front and rear surface of O1.

MKIII PROBLEM : Thu Sep 17 19:15:18 GMT 1998

Mangin mirror iris adjustment ring was rotated a hair, less than 1 degree. fiducial marks were off by the thickness of the grease pencil marks and tape was crooked and a little torn. Repositioned it and re-taped it.

PSPT PROBLEM : Thu Sep 17 19:42:24 GMT 1998

Pulled out mirror drive card and mounted it on an extender after cooling it down. Will investigate whether 2000 UT Run will work without oscillation if the card is exposed to the cooler air outside of the rack.

PSPT PROBLEM : Thu Sep 17 19:53:19 GMT 1998

Also jury rigged a cooling fan to blow air onto heatsink.

Thu Sep 17 20:07:05 GMT 1998 CHIP End Water

PSPT PROBLEM : Thu Sep 17 20:44:47 GMT 1998

PSPT ran the 2000 UT observation and calibration program just fine.

Mirror drive semiconductor and heat sink was relatively cool to the touch right after program finished and went into wait mode.

It was quite hot compared to now when I pulled it out between the 1900 and 2000 UT runs.

Thu Sep 17 21:03:50 GMT 1998 CHIP End Water

PSPT PROBLEM : Thu Sep 17 21:07:50 GMT 1998

2100 UT observations started after one attempt to stabilize the active mirror. Got one

mirror oscillating... 29 more tries

message, then

Active mirror OK

message. The program then continued, but I could see the meters oscillating, both X and Y, at around a 1/sec frequency, mostly between +/- 4 millivolts with occasional swings between +/- 30 millivolts. Meters settled after 3 minutes. Then after a short period,

the oscillations resumed at the same frequency and amplitude variations.
Images were very soft. I paused writing this log entry and looked
at the PSPT again and found that after 11 minutes into the program,
The active mirror was again trying to find the image and the

mirror oscillating n more tries...

message started scrolling through.

This time they kept scrolling and the meters kept swinging,
this time at a 1 or 2/sec frequency at a +/- 4 millivolt amplitude
with occasional jumps to + or - 10 millivolts. Mirror driver is
cool.

When it got to 0 tries.... the message changed to

Cannot activate Active mirror...

Check sky condition...

Check mirror gain...

Type q to quit program...

xRMS xxx.xx yRMS yyy.yy QCsum qqqq

mirror oscillating -n more tries...

I don't think we will recover from this. I will halt system and
try Restart near 2200 UT.

PSPT PROBLEM : Thu Sep 17 21:36:12 GMT 1998

So much for cooling the driver. Removed fan, removed extender,
reinserted module into PSPT chassis.

PSPT PROBLEM : Thu Sep 17 21:51:01 GMT 1998

Tried Restart. Guider was trying to lock on sun, but cap was closed!!

quit, tried again, same thing. Trying Run.

PSPT PROBLEM : Thu Sep 17 21:57:04 GMT 1998

Run did not work. Cap opened, but guider did not point to sun.

Only Dec ran after homing and the spar looks like it is pointing
where the sun is in the morning at sunrise. Aborting tests.

Will see what happens tomorrow morning. BTW, started Run with
spar in last guided position, not at shutdown position.
