NOTE BY BEN: Fri Nov 18 21:40:12 GMT 2011

The 2701 LN2 fill dewar may have a problem with it's overpressure safty valve. It seems to remain open and slowly vent (c ompaired the the more common short burst to releave pressure.

The dewar has also devloped a small frost ring near the fill neck, also pointing to prolonged venting. The level gauge on the top of the dewar appears to have been rescaled with a sharpie, indiciating someone must have had trouble with it before.

On the manufactures scale we are just below full, but on the "sharpie" scale we are just above half full.

(FYI the dewar was deleivered two days ago)

If this loss rate is real we should reorder today or monday for deleivery next wednesday.

end
