KCOR COMMENT BY berkey: Mon Mar 09 18:09:41 GMT 2020

Stopping observing to attempt to blow off front and back of the O1.

____end____

GENERAL COMMENT BY berkey: Mon Mar 09 19:59:23 GMT 2020

PM Washed Kcor O1. Blowing off didn't work went ahead and washed the o1

KCOR COMMENT BY berkey: Mon Mar 09 20:07:51 GMT 2020

Near the larger linear structure there are now a pair of dots/points on the lens that will not wash off. For all these structures (dots and line), I first stated trying to wash the o1 with soap and water but with multiple applications no change was found.

Ratcheting up the area was flushed with isopropoal alchoal, following by soap and water flushes. Again no change.

Finally the area was dabbd with a small amount of acetene. Followew by a soap and heavy heavy flush of water. Again no changes to these structures.

Midigation effots were ended at this point; before doing a normal kind of soap and water flush of the whole lens to prepare for observing again.

GENERAL COMMENT BY berkey: Mon Mar 09 22:09:38 GMT 2020

Sky seems petty noisy due to aerosols

____end____

KCOR COMMENT BY berkey: Mon Mar 09 22:20:49 GMT 2020

Big fringes since last cleaning. Not sue why.

KCOR COMMENT BY berkey: Tue Mar 10 03:02:21 GMT 2020

Tried cleaning the front surface of the KCor O1 with first contact.

I had an issue with the O-ring dam around the mount. It didn't stay in place. I think I didnt let the material dry long enough, and part way thru the application of the material to the middle of the lens the o-ring lifted off and knid of curled up in a few places effectivity given us no dam there; espically since the spary on formula seemed thin with a lot of the material running toward the edges. On removable of the material I found that some first contact had flowed past the oring for most of the lenses outer diameter. This lead to some resiatul material getting left behind in most places around the lens mount. Some of this material on the outer edge also remained attached to the glass. Since the matieral on the glass all seemed to be under the apature stop, I decided to leave it in place; as I feel any midigation would leave some r esidue on the lens.

Ignoring the edge effects (under the apature stop), this application of first contact seemed to peel off the lens better than any other test I have done with FP. Interestingly on initial visial inspection the lens (front and bad) appeared to be dirty/dustier than I ever rememeber seeing a corona graph lens, but all of this dust easily blew off. (So sounds like I need to were a lab coat while carring/installing the lens.)

Skies are have enough aerosols this afternoon, that I am having a had time evaluation the image quality; but it seems like the fringe pattern we say before 23UT seem to be gone and I don't notice any other new glaring artifacts.

____end____

GENERAL COMMENT BY berkey: Tue Mar 10 03:54:49 GMT 2020

Skies have improved over the last couple hours, I think the first contact did a good job of cleaning.
