UCoMP COMMENT BY berkey: Fri Jun 25 16:56:35 GMT 2021

UCoMP Raid disk 8 failed last night as Lisa was leaving. System started beeping about 3 times a second.

Drive has been swapped out with a spare RAID array is now rebuilding should be done over the next few hours.

UCoMP COMMENT BY berkey: Sat Jun 26 02:03:11 GMT 2021

UCoMP mech-controller, mechanism feedback display seems to be wrong at various times today. At various points I think the shutter and diffuser was in the wrong position based on what was expected from the recipes. From what I could tell the

LED feedback was the only thing wrong. For example the LED would indicate the dark shutter was in; but the data showed solar data and the headers showed the shutter was out.

I have spent a good chunk of the day digging trying to understand the issue; but I cannot figure how to how to recreate it and tend to miss it when it randomly happens. More debugging and monitoring of this will have to happen going forward.

GENERAL COMMENT BY berkey: Sat Jun 26 02:36:27 GMT 2021

Heavy cirrus this morning, medium level of aerosols in the middle of the day, with increasing aerosols and clouds in the afternoon.
