****EVENT COMMENT BY berkey**** : Mon Feb 21 19:22:43 GMT 2022

Bright 5degree wide eruption seen in Kcor starting near PA70 at 18:56UT. Looks related to a bright narrow prominence seen in Halpha. Doesn't look like corona material is being ejected.

KCOR COMMENT BY berkey: Tue Feb 22 00:50:25 GMT 2022

Kcor beam train was inspected a couple times today, no obvious source for the large bullet hole in the NW that seems to move quickly SW over the course of the day. Most of the other bullet holes have smaller structure and appear to move NE.

If this bullet hole is coming from the O1 it seems to have a different light path in the telescope, going the opposite direction at many $\times(10?)$ the speed.
