UCoMP COMMENT BY berkey: Thu Jun 16 17:46:11 GMT 2022

Inspected the cropico config. According to the front panel all rtds have the following config:

PT100

IEC751

R0=100

a=3850

3-wire

After visual inspection of the cables it appeared they were well seated. Cables were then pushed on to make sure they were completely; there was no indication that any of them moved.

After this inspection the TU_MOD temp jumped from about 31.7 to 32.6 at 17:28UT

UCoMP COMMENT BY berkey: Thu Jun 16 20:38:28 GMT 2022

Inspected the UCoMP beam train to try understand where the extra light/signal in the east side of the images was coming from.

Inspection looked at the lyot stop; and found that the stop didn't visibly move and was still blocking the inner ring. There was a bright spec of dust or something near the edge of the ring, so they stop was closed down a little under .5mm to block that spot.

The field lens appeared to also be in the appropriate position with the adjustment adapter set to put the lens all the way toward the cameras (which was the best position we found during our focus run).

Before leaving the lyot area, the field lens and modulator were blown off to remove acc

umulated dust.

The felt baffles around the cameras with 2 layers of Thorlabs BK5 material.

UCOMP COMMENT BY berkey: Thu Jun 16 20:39:46 GMT 2022

While putting the felt around the cameras a visual inspection of the tcam cameralink cables showed the cables were properly seated. To avoid needing to do a new focus run the cables were not touched and reseated.
