GENERAL COMMENT BY mcotter: Mon Jun 27 22:46:07 GMT 2022
The bright skies that were prevalent earlier have dissipated. Most of the high altitude Cirrus has moved to the northern part of the sky and the data images appear good. Aerosols are observable in the Kcor Quicklook images but not too excessive.

Aerosols continue to increase, as can be observed in the Kcor NRGF and Quicklook images. Though the images show elevated aerosol levels the images still look acceptable.
