**UCoMP PROBLEM COMMENT BY mcotter** : Sat Aug 13 17:17:05 GMT 2022
The Ucomp controller program did not open properly this morning as the filter wheel was
not found. I closed the program and restarted the computer. After restarting the compu
ter a couple of GUI's came up that said open programs were not closed properly and aske
d if they were to be saved, which I did. The Ucomp controller program has now come up w
ith the filter wheel identified, but now the camera LED is not illuminated. Last week I
 received instructions from Ben that if the Ucomp Controller program comes up and does
not see the camera to notify \mathop{\text{\rm him}}\nolimits_{\text{\tiny{\textbf{f}}}} Which I will now do.
**KCOR PROBLEM COMMENT BY mcotter** : Sat Aug 13 17:18:56 GMT 2022
The Kcor Stand Alone Image Acquisition program did not respond when it came up this mor
ning. I restarted the computer and now the Kcor programs seem to be operating normally.
  end
KCOR COMMENT BY mcotter: Sat Aug 13 17:19:19 GMT 2022
The Kcor instrument is now observing.

UCOMP COMMENT BY mcotter: Sat Aug 13 17:51:07 GMT 2022
The Ucomp instrument controller program was not working this morning when initiated. Th
e filter whell was not found at start up. After closing the program and restarting the
computer the controller program opened and found the filter wheel correctly, but this t
ime it could not find the cameras. After calling Ben he was able to diagnose a problem
with the camera sequence that was not being met which was causing the problem. Ben revi
ewed the program logic commands and corrected the sequencing. The Ucomp Controller pro
gram was restarted and it came up correctly and found the cameras with no problem.
The Ucomp instrument is now operating correctly and observing.

I checked the Instrument Status field of the Ucomp-Controller program and it appeared that the program was waiting for the filter wheel to move but it had gotten no response and indicated "Waiting over X minutes. for filter wheel to Move Abs \_8". Checking the Mech-Controller, the Home/Manual move Tab was selected and the Filter wheel was able to be commanded to move. The Filter wheel was hommanded to home and the final position ind

\*\*UCOMP PROBLEM COMMENT BY mcotter\*\* : Sat Aug 13 21:33:11 GMT 2022

The Ucomp background color turned Red while running through the cookbooks.

icated postion 8. This was the position that hte Ucomp-Controller program was looking f or when it got hung up so I started the controller program going again. After a moment or two the image shown on the Ucomp-Controller program came up but it did not look correct, with the appearance that the occulter ring was quite wide and bright. I immediately put the Controller program into cloud mode to prevent over saturation of the detector while I figured out how to proceed next.

I commanded the filter wheel to move 1 position to it's relative position and it moved into position 9 according to the "Final Position" field. Again the filter wheel was comm anded to move one position and it moved to position 0 with no problem. This command was repeated a few nore times to confirm that the filter whell was moving as commanded and each time it appeared to function and to respond to the command correctly. I restarted the Controller Program and the image continued to look incorrect. I tried skipping to the next recipe step (#4), but after a few moments nothing appeared to change. The program was again paused with the Cloud command and while the program was in pause I ad vanced the recipe to #5, then released the clouds button and restarted the program, to see if doing the recipe advance while in the pause mode would make a difference. It mad e no difference and the program restarted and after waiting a few moments the image con tinued to look incorrect and over saturated. I am uncertain how to proceed, as I believ e this anomaly may be due to an issue with the software. I am going to call Ben and see if he may be able to trouble shoot this condition remotely. I was able to reach Ben on the phone and he instructed me to engage the "Reconnect Filter Wheel" icon on the desk top. I engaged the icon and a black GIU appeared. I then went back to the Ucom-Control ler program and unengaged the Clouds button to unpause and restart the Controller Progr am. I waited a few moments but the image continued to look the same; a very wide corona l ring and over saturation. I relayed this condition back to Ben and he instructed me t o try restarting the computer. The computer was restarted (\*\*NOTE\*\* There is a small ye llow dot next to the poser button indicating a software update is pending. I did not el ect to do any updates at this time, as this is an issue Ben should decide upon). The co mputer came back up as normal but when the Ucomp-Controller program restarted as it did not find the filter wheel. I again exited the controller program and restarted the Uco mp-Controller program. When the Ucomp-Controller GUI it still did not see the filter wh eel. I minimized the Controller GUI and engaged the Reconnect Filter Wheel Icon. The Uc omp-Controller still could not find the filter wheel. This time I went to the Ucomp com puter and manually pulled the power plug, waited 30 seconds, then reinserted the power cord and re-energized the computer. Again the compute came up normally. The Ucomp-Contr oller program was restarted and this time the filter wheel was found but the camera LED did not illuminate. There is an Icon on the desk to called "Power Cycle Camera". I mov ed the controller GUI out of the way and tried engaging this button but nothing appeare d to happen and the Ucomp-Controller program Camera LED remained off. I went to the bac k of the Ucomp computer rack and could see that on the remote controlled power strip th at #13 & #16 power receptacles appeared to be off as the green LED next to them were no t illuminated. Numbe3 13 is "Heater/Sutter Power" and # 16 is "Camera Power". I again w ent to the desk top Icon labeled "Power Cycle Camera" and tried it. I could see that a black GUI appeared for a moment and a couple of script commands were noted, but this ma de no difference and the Ucomp-Controller "Camera LED still remained off. I am uncertai n at this time how to proceed so I have sent a message to Ben and have asked him to cal 1 me and give me further instructions.

WEATHER COMMENT: mcotter: Sat Aug 13 22:16:35 GMT 2022
The sky has become quite bright and Orographic clouds have moved up from the Saddle Val ley.
The sky is presently too bright to observe and the instruments are off.

\_\_\_ena\_\_\_ UCoMP COMMENT BY mcotter: Sun Aug 14 02:36:26 GMT 2022

When Ben called back regarding the Ucomp issues the sky had become overcast and observa tions were stopped. I explained to him about receptacle #13 & #16 not being lit and ask ed him if it would have been okay to plug the camera plugs into another receptacle that was energized to see if it would get the cameras working and satisfy the Ucomp control ler program. He said that would have been fine to do. Though I could not observe with U comp I did plug the camera's power plugs into different "energized" receptacle and the cameras came up and the Ucomp Controller program was satisfied. Ben told me if I did th

is to make sure to plug the camera power plugs back into receptacles #13 & #16 before I shut down so that he could trouble shoot the issue further this evening.

As of now it appears Ucomp is working correctly.

GENERAL COMMENT BY mcotter: Sun Aug 14 02:40:26 GMT 2022

I cleaned and organized the control room and IT area. The floors were vacuumed and the trash receptacle emptied.
