Dome pointed OK at startup. Guider was around 1/2 diameter off. This is probably due to yesterday's reset of pspt.exe. Running a gdr ephmcal routine before restarting up and starting daily observation.
PSPT COMMENT: Tue Jul 23 16:57:53 GMT 2002

active region on north limb between PA 345-10.
There is a faint, but large cloud of material moving across the disk in that region before the material appears above the limb. The faint cloud of material appears to have originated from large filament that was visible on the limb yesterday in the northwest quadrant.
